Escherichia coli K-12 chromosomal region from 92.8 to 00.1 minutes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                On Apr 17, 1996 this sequence version replaced gi:536929.
This sequence was determined as part of the E. coli Genome Project (Frederick R. Blattener, director) at the University of Misconsin-Madison. Supported by award HG00301 from the NIH Human Genome Project. The entire sequence was independently determined from E. coli MG1655; overlaps with other sequence determined are annotated. The start of this entry overlaps the end of the entry ECUWW89 (100006) by 1885 bp.

                                                                                                                                                                                                                                                                                     ઠ
                                                                             à
                                                                                                                                                                                             The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidemidis polypeptide with any cc of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as given in the specification. Also described are: a recombinant expression vector of (1); vector; a cell comprising a recombinant expression vector of (1); comprising a nucleotide sequence of at least 8 nucleotides in length; a comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis of the composition for prevention or treatment of an S. epidermidis of a subject for S. epidermidis infection; compastion of an S. epidermidis polypeptide or its fragment; a subject for S. epidermidis polypeptide or its fragment; a subject for S. epidermidis polypeptide or its fragment; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide sample; a computer readable medium having recorded in it the nucleotide system for identifying fragments of the Staphylococcus genome of commercially importance; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus some and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus some and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment of the Staphylococcus some and/or plasmids; and identifying an expression modulating fragment of the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcus endodes a S. epidermidis protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.

2003-029926/02 P-PSDB; ABU43214 New antisense nucleic acids, useful for identifying proteins or scre for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

SEQ ID NO 34954; 1766pp; English. Claim

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) an bost cell containing the vector; (3) an isolated on the polypeptide (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular comply perpende (5) producing the polypeptide; (6) inhibiting cellular comply sense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular comply sense product or that has an activity against a biological pathway in which a proliferation, or that has an activity against a biological pathway of the proliferation, or that that inhibits cellular proliferation of an agene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation or multiple cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound is activity; (11) a culture comprising strains in which the test compound that inhibits proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, continued for proliferation in cells other than S. aureus, S. typhimurium, a proventy and discovery programs, or for screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, be neutronic format directly from WiPon at sevent or the printed specification, but was obtained in cell certuring the sequence and a compound and organism. The present sequence are one of the target for no int form part of the p ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes coli, Staphylococcus aureus, Salmonalla typhi, Klebsiella pheumoniae, coli, Staphylococcus aureus, Salmonalla typhi, Klebsiella pheumoniae, con setul for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to dentify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins continued compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous uncleic acids which are required for cell proliferation in a wide variety of of organiems. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent continued for the printed specification, but was obtained in the first and the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued in the continued i

(DSQU-) D-SQUARED BIOTECHNOLOGIES WPI; 2003-300870/29 P-PSDB; ABR41865. Scott DL; Novel

Novel surface-exposed immunogenic polypeptide of Staphylococcus aureus containing receptors for siderophores or iron-binding ligands, useful for producing antibodies effective against Staphylococci infection. surface-exposed immunogenic

Claim 4; Page 53; 62pp; English.

The present sequence is that of DNA encoding novel Staphylococcus aureus surface-exposed immunogenic polypeptide (SEIP) D2 SA03. To isolate SEIP auriaces, an expression library of S. aureus genomic DNA was screened with anti-SEIP antisera. DNA was isolated from clones expressing SEIPs, and functional domains. The SEIP encoded by the present DNA sequence has sequence homology with the siderophore family of periplasmic binding production and recovery of SEIPs. The SEIPs can be used individually, or in combination, to produce anti-staphylococcal antibodies useful in passive or active immunisation strategies to prevent or contain straphylococcal infection. They can also be used to develop diagnostic авваув

```
The invention relates to an instrated nutritication where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

Co fithe nucleic acid inhibits proliferation of a cell. Also included are:

Co encoding a polypeptide whose expression is inhibited by the antisense

nucleic acid; (2) a host cell containing the vector; (3) an isolated

co polypeptide or its fragment whose expression is inhibited by the

nucleic acid; (2) a host cell containing the vector; (3) an isolated

co polypeptide or its fragment whose expression is inhibited by the

co proliferation or the activity of a gene in an operon required for

proliferation; (7) identifying a compound that influences the activity of

required for proliferation, or that inhibits cellular proliferation; (8)

co proliferation; (7) identifying a compound that influences the activity of

required for proliferation, or that inhibits proliferation or the biological

corpused a gene required for cellular proliferation of an

corpused a gene required for cellular proliferation of an

corpused a gene required for cellular proliferation of an

corpused a gene required for cellular proliferation of an

corpused a gene on which the test compound that inhibits proliferation

compounds activity; (11) a culture comprising strains in which the gene

compounds activity; (11) a culture comprising strains in which the

compounds activity; (11) a culture compound that inhibits the

compounds activity; (11) a culture compound that inhibits the

crowning activity; (12) a compound that inhibits the

crowning activity; (13) dentifying the target of a compound that inhibits the

crowning proteins or screening for homologous nucleic acids are useful for

clear inflying proteins or screening for homologous nucleic acids required

contrains activity activity or activity and an interpression or and acids are useful for actional activity and activity and activity and activity and activity and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target profearyoric essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                            invention relates to an isolated nucleic acid comprising any

The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepais in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of novel S. aureus genes of the invention

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia Coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify οŧ New polynucleotides for the identification and development antibiotics, comprise sequences of antisense nucleic acids. Claim 27; SEQ ID NO 4404; 511pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
antibodies capable of binding to the expresse these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes con their use in the discovery of novel antibiotics, the essential genes at the protection of proteins. The prokaryotes used are Escherichia to the staphylococcus aureus, Salmonalla typhi, Klebbiela pneumoniae, con sedul for the identification of potential new targets for antibiotic cuseful for the identification of potential new targets for antibiotic con tribodies capable of binding to the expressed proteins, and to obtain contributes used in proliferation, to express these proteins and to obtain contibents used in proliferation, to express these proteins and to obtain contibents and to state of antibenes and sequence is also useful to screen for homologous contisense nucleic acid sequence encodes an essential prokaryotic of organisms. The present sequence encodes an essential prokaryotic of organisms. The present sequence encodes an essential prokaryotic collular proliferation protein. Note: The sequence date for this patent coll not form part of the printed specification, but was obtained in clear electronic format directly from WIPO at

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of movel antibiotics, the essential genes their use in the discovery of movel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonalla typhi, Klebbiella pneumoniae, CC seeddomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain compounds in rational drug discovery programmes. The autisense nucleic acids sequence is also useful to screen for homologous contisens acid sequence is also useful to screen for homologous contisens acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent contine format directly from WIPO at the contine format directly from WIPO at the contine format directly from WIPO at the contine format directly from WIPO at

The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, producing hyperimmune serum-reactive antigens from a pathogen, a tissue or host prone to auto-immunity, where the antigens are pool of a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the configuration and the serum-reactive antigens comprising any of the immunity. The hyperimmune serum-reactive antigens comprising any of the immunity. The hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, against S. aureus or S. epidermidis. The infections or colonisation against S. aureus or S. epidermidis. The corporation of antibodies is useful for the manufacture of a medicament of preparation of antibodies is useful for the manufacture of a medicament or search or preventing staphylococcal infections or colonisation caused for diagnostic and imaging purposes. Other conditions may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This method for identifying and producing pathogen specific antigens of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying, isolating and producing hyperimmune serum-reactive antigen
from a pathogen, for preparing vaccine or medicament for treating or
preventing e.g. staphylococcal infections, comprises providing antibody

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid

(1) a vector comprising a promoter operably linked to the antisense

(2) a host cell containing the but the antisense

(3) an isolated

(4) a nest call containing the but the antisense

(5) polypeptide (5) production the polypeptide by the antisense

(6) polypeptide (5) producting the polypeptide; (6) inhibiting cellular

(7) contiferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (8)

(8) the gene product or that has an activity against a balological pathway in which a proliferation-required gene or its gene product is the area of a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene or grading acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comparising strains in which the strains; or (13) identifying the excenting for monitoric acids required for orbiliferation of an organism. The antisense nucleic acids required for callular proliferation in cells other than S. auteus, S. typhimumian, C. for callular proliferation in cells other than S. areas, S. typhimumian, C. for callular proliferation in cells other than S. areas, S. typhimumian, C. functional agencies not be proliferation in cells other than S. areas, S. typhimumian, C. functional agencies Note: The sequence is one of the target prokaryotic essential gene necessary programs, or for screening for measures, S. typhimumian, C. functional directly from WIPO at the requence of the printed specification, but was obtained in the form part of the pri New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs. Claim 14; SEQ ID NO 7949; 1766pp; English. BP; 385 A; 115 C; 210 G; 250

The invention relates to movel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic atudies and as a target for antibiotics. This sequence represents one of

                                  The present sequence is that of DNA encoding novel Staphylococcus aureus surface-exposed immunogenic polypeptide (SEIP) D2 SA05. To isolate SEIP genes, an expression library of S. aureus genomic DNA was screened with anti-SEIP antisera. DNA was isolated from clones expressing SEIPs, and amino acid sequences were deduced and analysed for conserved and/or sequence homology with the SEIP encoded by the present DNA sequence has sequence homology with the siderophora family of periplasmic binding proteins. The invention provides methods for the identification, in combination, to produce anti-staphylococcal antibodies used individually, or passive or active immunisation strategies to prevent or contain standylococcal infection. They can also be used to develop diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          72
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               VallleGlyLeuLeuPheValLeulleAlaThrAlaAlaCysGlyAsnAsnSerSer

The polypeptide, and polynucleotide encoding it, are derived from Staphylococcus aureus. Calls expressing ligands binding the polypeptide can be used to isolated candidate compounds that

The present sequence encodes 3 Staphylococcus aureus proteins of unknown function. The present sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The encoded protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. sureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock
                                                                                                                                              Staphylococcus aureus protein; ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; baccerial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome; toxic shock syndrome; ss.

Generating an expression library of polynuclectides by introducing the linear integration cassette into the host cell and selecting or screening for host cells that produce the polypeptides of interest.

gxample 5; SEQ ID NO 20; 55pp; English.

The present invention describes a method for generating an expression CC library of polymuclectides integrated by homologous recombination into the genome of a competent Gram-positive bacterium host cell. The method cc comprises: (a) providing a non-replicating linear integration cassette: The method cc comprises: (a) a polymucleotide the polymetides cc and selecting or screening for host cells that produce the polymetides cc interest. The cassette comprises: (a) a polymucleotide encoding one or of interest. The cassette comprises: (a) a polymucleotide segment copprise of the polymucleotide of (l) and comprising a first homologous copprising a first homologous region located in the 3' end of the polymucleotide of (l) and comprising a second homologous region located in the 5' end of the polymucleotide of (l) and comprising a second homologous region located in the 5' end of the segment. The first and second homologous regions are at least 80, 1000 cr 1500 bp, each of which has a sequence identity of at least 80, 85, 90 cr 1500 bp, each of which has a sequence identity of at least 80, 85, 90 cr 1500 bp, each of which has used cell genome. Also described: (l) a cor 1500 bp, with a region of the host cell genome. Also described: (l) a cor 25-100 with a region of the posticity of polymucleotides integrated by in generating an expression library of polymucleotides integrated by homologous recombination into the genome of a competent Gram-postivive cor present invention.

C strain MB1510 integration region, which is used in an example from the present invention.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 14; SEQ ID NO 35107; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression to the 6213 antisense sequences given in the specification where expression (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) an best cell containing the vector; (3) an isolated of antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the pense product or that has an activity against a biological pathway in which a proliferation-required gene product lise crequired for proliferation, or that inhibits cellular proliferation of an identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or tis gene product lise or a gene on which the test compound that inhibits proliferation of an compound sactivity; (11) a culture comprising strains in which the extent or operation of an organism activity; (12) a culture comprising strains in which the extent or which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational required for proliferation in cells of a compound that inhibits the contiferation of an organism. The present sequence data for this patent did required for proliferation to isolate candidate. Sequence is one of the target of proveryprograms, or for screening homologous nucleic acids required for proliferation in cells order than S. auteurs, s. typhimmrium, or the printed for proliferation to isolate candidate. Sequence data for this patent did celectronic format directly from Windows.

New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. Zyskind JW; Xu HH; Haselbeck R, Ohlsen KL, Yamamoto R, Forsyth RA, Malone C, Carr GJ, Zamudio C, Trawick JD, WPI; 2003-029926/02. P-PSDB; ABU38966. ijĠ Wang Wall

Claim 14; SEQ ID NO 30706; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular concerns the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological

```
pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antiblocic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or collection of conversed the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for proliferation of an organism. The candidate molecules for rational correquired for proliferation in calls other than S. aureus, S. typhimurium, crequired for proliferation in cells other than S. aureus, S. typhimurium, crequired for proliferation in cells other than S. aureus, S. typhimurium, broken proxem part of the printed specification, but was obtained in celectronic format directly from WIPO at clear for this patent did electronic format directly from WIPO at clear for this patent did for wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 897 BP; 293 A; 176 C; 195 G; 233 T; 0 U; 0 Other;

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in cher Bacillus cells, comprising hybridising labelled nucleic acid probes cother Bacillus cells to a substrate containing array of Bacillus cells to a substrate containing array of Bacillus comported tags (GST) examining the array, and determining to relative gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of constraints in a first Bacillus cell relative to expression of the same genes con more second Bacillus cells. The method is useful for monitoring new companies in a first Bacillus cells. The method is useful for monitoring consistent acid for the condition of the same stability in dentitoring sene copy number variation and stability. Monitoring changes to in expression of genes may be used to provide a representation of the way companies may be used to provide a representation of the way companies are presentation of the particular cells adapt to changes in culture conditions.

The conditions are copy number to changes in culture conditions are presented by conditions.

The conditions are copy in changes in culture conditions are presented by conditions conditions are presented by the condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy condition of the copy copy condition of copy copy conditions

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are sources of probes and primers for detecting the genome of P. luminescens of cources of probes and primers for detections to set of the genes. Antibodies (Ab) raised against the and related species, to study polymorphisms, for gene analysis and for detection/damplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/dentification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to five genes in plants, animals or microorganisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. croominant production of the proteins, particularly toxins and cantibacterials useful as insecticides, bactericides and fungithat cantibacterials useful as insecticides, bactericides and fungithat care sensitive to P. luminescens and ab are also useful therespeutically (to treat microbial infection by bacteria or fungi that care sensitive to P. luminescens and the proteins are as virulence consensitive to the proteins are as virulence consensitive to the sensitive to the sense of the genes and the proteins are as virulence consensitive to the sense of the genes and whooping cough). This sequence represents one of the isolated P. luminescens genes
                                                                                                                                                                                                                                                                                                                                           Antibacterial, fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague; whooping cough; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 c sequence of Photorhabdus luminescens and encoded polypeptides e.g. as therapeutic antimicrobials and agricultural pesticides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           142
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        83 AlaAspAspAspLysLysLysAsnArglleIleLysProLeuArgAspLysIleGlyLysTyr 102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises the amino acid and coding sequences of proteins from Photorhabdus luminescens which are active against insects. The proteins of the invention are toxic to Lepidoptera, specifically the genera Plutella, Helichia, Helicoverpa, Spodoptera and ostrinia. The DNA and protein sequences of the invention are useful in the preparation of transgenic, insect-resistant plants, specifically wheat and maize. The present Photorhabdus luminescens genomic DNA contains the coding sequence for the two insecticide proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid from Photorhabdus luminescens, useful for producing insecticidal polypeptides active against Lepidoptera, and for producing insect resistant transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LeullellealaAspasnAsnArgHisLysGlylleTyrLysAspLeuAsnLyslleAla

Forsyth RA,

:

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

Continuous a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated on the polypeptide; (5) producing the polypeptide; (5) producing the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular continuous proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway to the proliferation, (7) identifying a compound that inhibits proliferation of an operon required for proliferation, or that thas an activity against a biological pathway in which a proliferation-required gene product the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the proliferation-required gene or its gene product lies or a gene on which the proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an conganism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the colliferation of an organism. The antisense nucleic acids are useful for for scilleration of an organism. The antisense nucleic acids are useful for colliferation of an organism. The succession of active active active active active for proliferation of an organism. The present sequence is one of the target of creduit discovery programs, or for screening honologous nucleic acide active continuous or P acroginous proliferation in cells other than S aureus, S typhimuring content of the printed specification, but was ftp.wipo.int/pub/published_pct_sequences

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes coll, Staphylococcus aureus, Salmonala typhi, Klebbiela pneumoniae, coll, Staphylococcus aureus, Salmonala typhi, Klebbiela pneumoniae, coll, Staphylococcus aureus, Salmonala typhi, Klebbiela pneumoniae, conseful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain contracts antisense nucleic acids captured for the expressed proteins. The proteins can in rational drug discovery programmes. The breast sequence encodes an essential prokaryotic of organisms. The present sequence encodes an essential prokaryotic collular proliferation protein. Note: The sequence data for this patent collular proliferation protein. cc (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense cucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide acid; (2) a host cell containing the vector; (3) an isolated autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway or proliferation, or that inhibits cellular proliferation; (8) identifying a gene product or that has an activity against a biological pathway in which a proliferation-required gene or its gene product is capanism acts; (9) manufacturing an antibiotic; (10) profiling a corpanism acts; (9) manufacturing an antibiotic; (10) profiling a product is overexpressed or underexpressed; (12) determining the extent compound that inhibits the proliferation of the strains is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids required cor proliferation in cells other than S. aureus, S. typhimurium, corporating discovery programs, or for screening homologous nucleic acids for regional drug discovery programs, or for screening for homologous nucleic acids for required for proliferation in cells other than S. aureus, S. typhimurium, content form part of the printed specification, but was obtained in celectronic format directly from WIPO at the sequence of the printed specification, but was obtained in

The invention relates to a method of identifying compounds that modulate a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulators. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAS46232-AAS46278 represent

The invention relates to an isolated nucleic acid compirising any one of the 6213 antileanse sequences given in the specification where expression of the 6213 antileanse sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid of the observation of antileanse expression is inhibited by the antisense concleic acid; (2) a host cell containing the vector; (3) an isolated continued by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense cc proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway the sequired for proliferation, or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (8) required for cellular proliferation or the biological dentifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling of an organism acts; (10) manufacturing an antibiotic; (10) profiling the extent or obliferation of the strains is present in a culture or collection of compound, activity; (11) a culture comprising strains in which the gene or underexpressed or underexpressed; (12) determining the extent or obliferation of an organism. The antisense nucleic acids required contains and organism. The antisense nucleic acids required contains and organism. The antisense nucleic acids required contains and proliferation of an organism. The antisense nucleic acids required contains and prover and address modeled are useful for an all was proliferation or the strains of an organism or screening for homologous nucleic soles required to a conditional activity; (10) activity in the proliferation or the strains or acceening for homologous nucleic soles required to a conditional activity and an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zyskind JW;
Xu HH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New antisense nucleic acids, useful for identifying proteins or scre
for homologous nucleic acids required for cellular proliferation to
isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention relates to an isolated nucleic acid comprising any
                                                                                                                                                                      proliferation;

The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, callergen, a tissue or host prone to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma of a type of animal, or individual sera with antibodies against the pool of a type of animal, or individual sera with antibodies against the comprise of a type of animal, or individual sera with antibodies against the immunity. The hyperimmune serum-reactive antigens comprising any of the contingual the preparation particularly a vaccine against staphylococcal infections or colonisation against staphylococcal infections or colonisation against staphylococcal infections or colonisation against staphylococcal infections or colonisation against staphylococcal infections or colonisation against can be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral continued include cancer, autoimmune diseases or infections caused by viral continued for identifying and producing pathogen specific antigens of the invention.

This sequence represents Staphylococcus aureus cbrA DNA. The cbrA protein is predicted to have a molecular weight of about 36.8 kD and, along with cbrB (AAY42332) and cbbc (AAY42333), is thought to be involved in iron regulation, based on amino acid sequence homology with known iron regulation, based on amino acid sequence homology with known iron regulator proteins. S. aureus is a ubquircus pathogen which causes infections in burns, cellulitis, eyelid infections, food poisoning, joint infections in conjunctivitis, exceptions, skin infections, surgical wound infection, scalded skin syndrome and toxic shock syndrome. S. aureus is increasingly becoming resistant to known antibiotics, with methicillin-resistant S. aureus (MRSA) poses serious infection control problems, with the exception of the vancomyclin-type glycopeptide antibiotics. The protein may be useful to screen potential antagonists antibiotics. The protein may be useful to screen potential antagonists which could be used as antibiotics and it may be used as a vaccine to prevent or attenuate an infection caused by a member of the

The protein, or antibodies against it can be used in immunoassays to detect Staphylococcus in a biological sample. Probes and primers derived from the nucleic acid sequences may also be used to detect Staphylococcus nucleic acids in a biological sample

Claim 1; Page 24; 102pp; English.

This is the nucleotide sequence of Staphylococcus aureus strain ISP3

(ATCZ 202108) genomic DNA including the novel cbrA gene that codes for a 310-amino acid protein (see AAY1824) of predicted mol.wt. 36.8 kDa. The sequence was obtained from overlapping clones BTACA44 and BTAGU54, which AAD1889-91). CbrA shows sequence homology to known genes involved in iron regulation. The invention provides 11 novel genes (see AAX1889-92) of S. aureus and the polypeptides they encode (see AAX18181-27). Also provided are vectors, host cells, antibodies and hybridomas. The invention further relates to screening methods for identifying agonists and antagonists of S. aureus polypeptide activity, and to diagnostic methods for detecting Staphylococcus nucleic acids, polypeptides and antibodies in a biological sample. Antagonists of cbrA may be useful as antibodies in a biological sample. Antagonists of cbrA may be useful as antibotics to treat infections of S. aureus and other Staphylococcus spp. Infection by Staphylococcus. The isolated nucleic acid molecule is also broduction of cbrA protein

The invention describes a new isolated nucleic acid molecule comprising: a sequence that is 95% identical to a fully defined sequence having 586-226 bp, or its complement; or a sequence encoding a polypeptide having a fully defined sequence comprising 136-691 amino acids, or its complement. The gene is Staphylococcus aureus gene. The nucleic acid is useful for preventing or attenuating an infection caused by a Staphylococcus, detecting Staphylococcus nucleic acids in a biological sample obtained from an animal, and detecting Staphylococcus antibodies in a biological sample obtained from an animal. The present sequence is that of DNA encoding novel Staphylococcus aureus surface-exposed immunogenic polypeptide (SEIP) D2 SA02. To isolate SEIP sense, an expression library of S. aureus genomic DNA was screened with anti-SEIP antisera. DNA was isolated from clones expressing SEIPs, and amino acid sequences were deduced and analysed for conserved and/or functional domains. The SEIP encoded by the present DNA sequence has sequence homology with the sidecrophore family of periplasmic binding production and recovery of SEIPs. The SEIPs can be used individually, or in combination, to produce anti-staphylococcal antibodies useful in staphylococcal infection. They can also be used to develop diagnostic assays

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM, Homology searches using content of the Staureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are contined in a vaccine composition against Staureus infection. The be used in a vaccine composition against Staureus infection of collypeptides can also be used in a kit for the immunodetection of collypeptides can also be used in a kit for the immunodetection of including cellulitis, eyelid infections, food poisoning, osteonyelitis, syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used for their fragments) are useful as primers or probes for isolating chandle medium

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (3) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the contisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the antisense nucleic acid; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation or the biological pathway in which a proliferation, or that inhibits proliferation of an compound activity against a proliferation of an proliferation that inhibits proliferation of the strains is present in a culture or collection of the strains; or (13) identifying the target of a compound that inhibits the cross or dentifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibits the collidar proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids are useful collidar proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is one of the target New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs. Claim 14; SEQ ID NO 9415; 1766pp; English.

The invention describes a method of monitoring differential expression of capers in a first Bacillus cells relative to expression of the genes in other Bacillus cells, comprising hybridising labelled nucleic acid probes soluted from Bacillus cells to a substrate containing array of Bacillus containing sequenced tags (GST), examining the array, and determining capens in a first Bacillus cells relative to expression of a spot in the array. The method is useful for measuring the expression of cannot be more second Bacillus cells. The method is useful for monitoring new containing the expression of several genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and capens, identifying possible functions of unknown open reading changes in expression of genes may be used to provide a representation of the way in white Bacillus cells adapt to changes in culture conditions.

Convictoring gene copy number variation and stability. Monitoring changes in environmental stress or other physiological provocation. Extensive follow cup characterisation is unnecessary, when one spot on an array equals one correct expresents a genomic sequence information is available.

Continued the printed specification, but was obtained in electronic format correctly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                       308
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic sequenced tag

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of (II) is useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful in medical imaging of supplement. (II) and (II) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or bological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations of and to produce other types of data and products dependent on DNA and cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and confine sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the print of the product of produce of the invention are sequences.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping.

CC and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed conditions as expressed sequence tags for identifying expressed conditions as expressed sequence tags for identifying expressed conditions as expressed sequence tags for identifying expressed conditions as expressed sequences, responsible in gene therapy techniques to restore normal consistent of the protein expression or biological in medical imaging of supplement. (II) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders of polypeptide and polynucleotide sequences have applications in consisting and to produce other types of data and products dependent on DNA and cannot be produce other types of data and products dependent on DNA and conditions expensions for the invention. Note: The sequence data for this conding sequences of the invention. Note: The sequence data for this expension of mutations conditions and approar in the printed specification, but was obtained in expension of mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               65 GluTyrSerPheValAspAlaLeuValAlaLeuAspValLysProValGlyIleAlaAsp

the sequence listing in the specification. They are included to maintain the nucleotide numbering given the specification for this DNA sequence"
```

```
This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can composition against S.aureus infection. The polypeptides can also be used in a kit for the immundetection of S.aureus in a sample. S.aureus is food poisoning, osteomyelitis, shouly including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scaleds skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used can their fragments) are useful as primers or probes for isolating changes can be medium and augical mand and surgines are negetual so primers or probes for isolating changes can be medium chair fragments).

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain sequences. (I) is useful as hybridisation probes, polymerase chain caraction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of control of the control of control of the control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of control of contr

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
